AMENDMENTS TO THE CLAIMS

In the claims, please cancel claims 1-18 add new claims 24-32 as follows:

1-18. (canceled)

- 19. (original) A method for delivering a molecule to the cytoplasm of the cell comprising: associating said molecule with a reversibly inhibited membrane active polymer to form a complex and delivering said complex to said cell wherein said complex is endocytosed.
- 20. (original) The method of claim 19 wherein said molecule consists of a polynucleotide.
- 21. (original) The method of claim 20 further comprising: condensing said polynucleotide with a polycation to form a binary complex and recharging said binary complex by addition of said reversibly inhibited membrane active polymer to form a nanoparticle wherein said membrane active polymer is negatively charged.
- (original) The method of claim 21 wherein said polycation is crosslinked to said reversibly inhibited membrane active polymer via a pH-labile bond.
- (original) The method of claim 21 wherein said reversibly inhibited membrane active
 polymer disrupts an endocytic membrane thereby providing delivery of said molecule
 the cytoplasm of said cell.
- (new) The method of claim 19 wherein said reversibly inhibited membrane active
 polymer consists of a plurality of membrane activity inhibitors reversibly linked to a
 membrane active polyamine via pH labile bonds.
- 25. (new) The method of claim 24 wherein said inhibitors consist of maleamates.
- (new) The method of claim 25 wherein said inhibitors consist of disubstituted maleic anhydride derivatives.
- 27. (new) The method of claim 26 wherein said disubstituted maleic anhydride derivatives are derived from reaction of said membrane active polymer with disubstituted maleic anhydrides selected from the group consisting of: carboxydimethylmaleic anhydride, carboxydimethylmaleic anhydride-thioester, and carboxydimethylmaleic anhydride-polychtylene glycol.
- (new) The method of claim 27 wherein said inhibitors are cleaved from said polyamine in an endosome.
- (new) The method of claim 19 wherein said membrane active polymer has a molecular weight of at least about 10,000 Daltons.

Appl. No. 10/816,081 Amdt. dated 09/18/2006 Reply to Office action of 09/11/2006

- 30. (new) The method of claim 22 wherein said complex consists of a nanoparticle.
- (new) The method of claim 30 wherein said nanoparticle consists of a salt stable nanoparticle.
- 32. (new) The method of claim 31 wherein said complex has a net negative charge.
